

Angular 4 – What's New?

Angular 4 is NOT a complete re-write of Angular 2, indeed, it shouldn't introduce any breaking changes. Some features will be deprecated (i.e. they still work but will get replaced with the next major Angular version), some new features were added.

Why is it named Angular 4?

It's just Angular now – the framework should be named Angular. Have a look at the [this](#) blog post to learn more.

Angular 4 now supports TypeScript 2.0+.

This shouldn't break your code, but you can dive into the TypeScript Release Notes below. Maybe you want to use some of its new features!

About the Angular CLI

The CLI also finished its beta and release candidate phase, you can learn more about the changes [here](#).

To **upgrade the CLI**, run the following code (only use `sudo` on Mac/ Linux):

```
[sudo] npm uninstall -g @angular/cli angular-cli  
npm cache clean  
[sudo] npm install -g @angular/cli
```
